STABLE

Elevated week — 3 True P1s vs 2/wk 12-week average.

The key concern remains PIR action completion — at 42% against a target of 85%, this is a persistent gap. CRM CORE (19 open) and CRM Experience (17 open) are the largest contributors and need attention.

P1 INCIDENTS THIS WEEK 15 Jun – 21 Jun · 3 incidents

INC-9727 Overloaded Errors from Anthropic

Resolved15 Jun · 07:05 UTC

Anthropic returned 529 overloaded errors and at times delivered garbled, incoherent AI responses, causing FT AI to fail or respond incorrectly for partners across multiple brands. 19 error requests in the prior 24 hours disrupted FT AI for partners across multiple brands. The rigid formatting requirement for Anthropic responses was removed (PR #378) and affected brands were migrated to AWS Bedrock, which restored coherent and stable AI behaviour across all brands.

INC-9938 Upgaming Platform Issues

Resolved17 Jun · 17:13 UTC

Multiple Upgaming platform services stopped processing messages because consumer pods got stuck on unprocessable 'poison' messages at the head of RabbitMQ queues, halting CRM integration, email distribution, and bonus distribution for several brands. Customers of Ginjabet, Rolletto, Betfast, and Jackbit experienced delays or failures in CRM integration, email distribution, and bonus distribution actions. All affected partners were notified and kept informed throughout the incident.

INC-10256 Memory DB Betconstruct Cluster production-274-gen ...

Resolved20 Jun · 05:07 UTC

MemoryDB on the production-274-gen cluster exceeded 90% memory usage, causing the scheduled-actions-manager service to halt and message queues to grow for multiple brands. Scheduled actions and campaign messages stopped processing across at least 19 brands from around 03:30 UTC. Upgraded MemoryDB to db.

NOTES & CONTEXT

PIR action item completion

Following a meeting with Juan, Linus, and Producers, we have agreed to a more focused format for the weekly PIR review, with the Head of SRE owning and prioritising action items going forward.

Betconstruct platform incidents

Two open incidents require Betconstruct to acknowledge: a double-bonus event bug on H2Bet and a Rewards section visibility issue on Galabet. Siria and Robert have been engaged, and we are now escalating to B2B to establish a more robust incident channel with our platform provider.

## Overloaded Errors from Anthropic

### PROBLEM

Anthropic returned 529 overloaded errors and at times delivered garbled, incoherent AI responses, causing FT AI to fail or respond incorrectly for partners across multiple brands.

### IMPACT

19 error requests in the prior 24 hours disrupted FT AI for partners across multiple brands. The most impacted brand was Gamius (4 errors), with Gembet, Reactivation, Kenhowells, Shuffle, Weindonesia, Onetwoplay and Betzilo also affected. Some responses were not delivered, others were jumbled but passed system checks and were still surfaced to users.

### CAUSE

A recent code change required the AI assistant to format responses in a very rigid way which had been needed for Fable but was not compatible with the Anthropic model. The rigid formatting requirement caused Anthropic to occasionally return garbled output that still passed validation. Anthropic's servers were also under load and returning API 529 errors, compounding the user-visible impact.

### ACTIONS TAKEN

The rigid formatting requirement for Anthropic responses was removed (PR #378) and affected brands were migrated to AWS Bedrock, which restored coherent and stable AI behaviour across all brands. The fix is fully rolled out. The incident is now in the Documenting phase while the team completes the post-incident write-up; no further user-facing remediation is pending.

INC-9938 Resolved

## Upgaming Platform Issues

### PROBLEM

Multiple Upgaming platform services stopped processing messages because consumer pods got stuck on unprocessable 'poison' messages at the head of RabbitMQ queues, halting CRM integration, email distribution, and bonus distribution for several brands.

### IMPACT

Customers of Ginjabet, Rolletto, Betfast, and Jackbit experienced delays or failures in CRM integration, email distribution, and bonus distribution actions. At peak, Rolletto had over 2.5 million unprocessed messages and all affected brands saw message processing halted for an extended period. Platform services have since been restored across all four brands.

### CAUSE

Repeated operator/proxy API errors (HTTP 500/404) generated 'poison' messages at the head of RabbitMQ queues. These caused consumer pods for several Upgaming platform services to crash-loop, preventing any subsequent valid messages from being processed until the bad messages were cleared.

### ACTIONS TAKEN

All affected partners were notified and kept informed throughout the incident. Forwarders were scaled down to prevent further message build-up, then restored as queues were cleared. Rolletto's bonus queue was cleared, their RDS was temporarily upgraded to address performance issues, and Betfast's bonus queue was released per their requests. Ginjabet's previously blocked queues have now been resolved and the incident is closed.

## Memory DB Betconstruct Cluster production-274-gen over 90%

### PROBLEM

MemoryDB on the production-274-gen cluster exceeded 90% memory usage, causing the scheduled-actions-manager service to halt and message queues to grow for multiple brands.

### IMPACT

Scheduled actions and campaign messages stopped processing across at least 19 brands from around 03:30 UTC. Automated notifications, bonuses, and scheduled messages were delayed for all affected brands, with large backlogs building up — over 1.2 million messages queued for Seu Bet and nearly 384,000 for Segurobet.

### CAUSE

A surge of scheduled actions from Seubet (two activities each targeting over 2 million users) queued more than 5 million actions at once, consuming ~78 GB and pushing the shared MemoryDB cluster above 90%, which triggered the scheduled-actions-manager into a shutdown/restart loop.

### ACTIONS TAKEN

Upgraded MemoryDB to db.r6gd.4xlarge then db.r6gd.8xlarge to add capacity, allowing the queue to drain and service to restore. Seubet advised to stagger large sendouts by 30-45 minutes; alert thresholds under review for earlier warning.

## SSRF exploitation chain suspected in crm-api (FTCRM prod)

### PROBLEM

An active SSRF exploitation chain was detected in the crm-api service running in FTCRM Shared Production. The attacker leveraged a vulnerable Ceram back-office dropdown/accepts endpoint to probe internal resources, including the in-cluster Kubernetes API server, and ultimately created two unauthorised admin users using a compromised legitimate customer account.

### IMPACT

The crm-api container made unauthorised outbound DNS and TCP connections, and two backdoor admin users (security.test@fasttrack.ai and security.audit@fasttrack.ai) were created via the compromised account. A third user (renato.caldara@fasttrack.ai) had their password reset. No evidence yet of successful external login with these new credentials, but the incident represents a real CRM integrity exposure and forced the affected API to be scaled down to stop further activity.

### CAUSE

A SSRF vulnerability in the back-office dropdown/accepts endpoint allowed outbound network requests from within the crm-api pod, and a legitimate customer account (Camilla, user 167) was compromised and used to create admin users and reset a password. The developer role in the application incorrectly granted AdminUser create/update permissions, which is what enabled the privilege escalation once the account was taken over.

### ACTIONS TAKEN

The affected crm-api service has been scaled down and is being held down while investigation continues. The team has confirmed there was no authorised pen test, correlated change logs and audit data to attribute the unauthorised admin user creation, and is checking related brands for similar indicators. Outstanding work includes validating source IPs against WorkOS/login data, implementing URL allowlisting and egress restrictions for vulnerable endpoints, and reviewing Kubernetes and AWS audit trails for lateral movement. The incident is still active (Fixing) and the containment work is ongoing.

## WorkOS 401 Unauthorized Issue

### PROBLEM

Repeated 401 Unauthorized errors from the WorkOS authentication integration prevented users from logging into Fast Track across multiple major brands. Login failures spread quickly, triggering escalation from triage to a confirmed True P1 within ~30 minutes.

### IMPACT

Users from IBet, OneCasino, Meridianbet, and Roobet were unable to log into Fast Track between approximately 09:10 and 09:35 CEST on 2026-06-24. Betamina also reported login failures in the same window, later determined to be caused by an unrelated CRM-API pod failure. Multiple brands have since been migrated through a brand-tracking spreadsheet, with most confirmed working.

### CAUSE

A WorkOS-integration configuration issue in the crm-api caused authentication requests to fail with HTTP 401 for the affected brands. The CRM-API pods themselves were healthy, isolating the fault to the WorkOS integration layer. Betamina's parallel issue was a separate CRM-API pod failure with no shared root cause.

### ACTIONS TAKEN

Matteo Rapisarda (incident lead) drove a configuration change in the crm-api that restored login access for IBet, Meridianbet, OneCasino, and Roobet, with partner confirmation received for each. A brand-tracking sheet is being maintained to coordinate rollout and confirm status per brand. The incident remains in Fixing because a permanent fix is still being applied across all affected partners; Betamina's separate failure is being remediated independently.

INC-8064   Monitoring · awaiting fix

26 May · 15:47 UTC

## H2Bet Production

### PROBLEM

Duplicate bonuses are being granted to H2Bet players when BetConstruct returns an HTTP 503 error after already crediting a bonus, causing retries that result in additional grants. This pattern has been occurring intermittently for at least 24 weeks.

### IMPACT

Recurring bonus leakage for H2Bet users, with approximately 300–500 extra bonus grants per week over the past 24 weeks. Both FreeSpins and Cash bonuses are affected. No new duplicates were observed during the weekend of 6–7 June 2026, but around 300 duplicate grants per week continued to occur leading up to mid-June.

### CAUSE

BetConstruct can return HTTP 503/5xx errors after a bonus has already been credited to a player, while Fast Track's retry logic then re-issues the request, resulting in duplicate grants. This is not the expected behaviour of the operator API and stems from BetConstruct's inconsistent response semantics rather than a Fast Track defect.

### ACTIONS TAKEN

Enhanced logging and monitoring were deployed (PR #123) enabling rapid detection of duplicate events. A partner-specific workaround to treat 503 responses as success was proposed but rejected by H2Bet due to traceability concerns. Efforts continue to produce detailed impact analysis and escalate the issue with BetConstruct for a long-term upstream fix. No technical mitigation has yet been deployed; the incident remains in Monitoring while awaiting BetConstruct's response.
